Dear Rajat,

I hope you're doing well. Our mutual acquaintance Bhavishya Pandit suggested I reach out to you, he speaks highly of your work with the Google Cloud team.

I am currently leading the engineering deployment of an AI-powered regulatory automation framework for the Kerala State Electricity Regulatory Commission (KSERC), developed under an official Memorandum of Understanding (MoU) executed between KSERC and Rajadhani Institute of Engineering and Technology (RIET).

Upon project completion and formal handover, KSERC will assume full operational ownership and custodianship of the system, with the option to maintain it on their institutional infrastructure or migrate it to their dedicated Google Cloud Platform project.

Here's where my team is stuck: when I tried to set up student credits to keep the project running, Google asks for a Fixed caution deposit amount, which has slowed things down. My token allocation is exhausted from the heavy data processing involved.

DOCUMENTATION ATTACHED

To facilitate a comprehensive review of our implementation scale, I am attaching:

- The official Work ordsr/MoU(Proof of legitimacy).
- The technical overview document.
- Posters from our recent technical workshops validating our community execution capabilities.

Would it be possible to explore a path forward with the credits, or at least get some guidance on how to handle this?

I really appreciate your time, and thanks so much for considering this.

Best Regards,
Prakhar Sharma

Hi Prakhar,

Great to meet you, and thanks to Bhavishya for the introduction!

The regulatory automation framework you are building for KSERC sounds incredibly impactful. Moving public sector infrastructure to AI-driven models is no small feat, and it's great to see RIET and KSERC collaborating on this. I reviewed the live link and the documentation you attached - excellent work on getting the deployment to this stage.

I completely understand the frustration regarding the billing hold and token exhaustion. Transitioning from development to a production-scale architecture always comes with these friction points, but we can definitely get this sorted out.

Here is what is likely happening and how we can move forward:

1. The "Caution Deposit" (Billing Verification) The fixed deposit prompt you are seeing is almost certainly a temporary authorization hold (typically ₹2). Because of RBI (Reserve Bank of India) regulations regarding e-mandates and recurring payments, Google Cloud requires an initial authenticated transaction to verify the credit or debit card on file. This is not a permanent fee; it is automatically refunded once the card is verified. You will not be charged further unless you manually upgrade to a paid billing account.

2. Upgrading from Student Credits Standard student credits are generally not designed for the heavy token usage required by LLM data processing.

Keep up the great work, and let me know if you'd like to set up a brief Google Meet to walk through the architecture!

Best regards,

Hi Rajat,

Thank you for your time in reviewing our deployment and considering this issue.

Regarding the design, the final version will move away from the current minimalist style toward a traditional government webpage aesthetic.

On the technical side, I had already followed your suggestion and set up autopay via Google Pay and debit card. However, after completing the setup, the system requested a ₹1,000 caution deposit to approve the student credits. I have already requested a new college domain ID for these credits, but the system still prompts for the ₹1,000 payment to acquire the credits that are advertised as free.

In a previous attempt, I paid the deposit, but I did not receive the $300 credit, nor was I able to use the ₹1,000 deposit. That amount was held for several weeks before eventually being refunded. We have remained at the current deployment stage since then.

I apologize that my last email lacked these details. I hope this provides more clarity and that you can help us find a solution.

Best Regards,
Prakhar Sharma
